3.50.2.4.2 Binaural masking level difference and spatial release from masking. One advantage of binaural hearing is the improvement in sensitivity to target sounds that results when

Access Free Binaural And Spatial Hearing In Real And Virtual Environments

target and competing sounds are perceived as coming from different spatial locations. In the laboratory, one form of this advantage, the binaural masking level difference (BMLD), has been extensively studied.

Binaural hearing refers to being able to integrate information that the brain receives from the two ears. Binaural hearing is known to help us with the ability to

Access Free Binaural And Spatial Hearing In Real And Virtual Environments

listen in noisy, complex auditory environments, and to localize sound sources. In the Litovsky lab, we study binaural hearing in persons who have normal hearing and in persons who are deaf and use cochlear
