DNA Microarrays

DNA microarrays are solid supports, usually of glass or silicon, upon which DNA is attached in an organized pre-determined grid fashion. Each spot of DNA, called a probe, represents a single gene. DNA microarrays can analyze the expression of tens of thousands of genes simultaneously.

Labeling nucleic acids for use in microarrays is similar for most microarray platforms, except for Affymetrix microarrays. For most platforms (homemade or commercial), fluorescent molecules are attached to DNA by the Klenow fragment of DNA polymerase I. For labeling RNA, reverse transcriptase is used to prepare labeled cDNA.

Printing Microarrays - Molecular Cloning

A DNA microarray is a collection of microscopic DNA spots attached to a solid surface. Scientists use DNA microarrays to measure the expression levels of large numbers of genes simultaneously or to genotype multiple regions of a genome. Each DNA spot contains picomoles of a specific DNA sequence, known as probes. These can be a short section of a gene or other DNA element that are used to hybridize a cDNA or cRNA sample under high-stringency conditions. Probe-target hybridization is usually dete
