Drug Treatment in Psychiatry - PubMed Central (PMC)

A psychiatric or psychotropic medication is a psychoactive drug taken to exert an effect on the chemical makeup of the brain and nervous system. Thus, these medications are used to treat mental illnesses. Usually prescribed in psychiatric settings, these medications are typically made of synthetic chemical compounds. Since the mid-20th century, such medications have been leading treatments for a broad range of mental disorders and have decreased the need for long-term hospitalization, therefore

Psychiatric medication - Wikipedia

Drug Treatment and Psychiatry The use of drugs in psychiatry Many of the original 20th-century drug treatments for psychiatric disorders, including attention-deficit hyperactivity disorder (ADHD), schizophrenia, depression, and bipolar mood disorder, were based on serendipitous findings. In the 21st century, we are able to develop psychiatric drugs in a more logical manner, on the basis...

Drug Treatment and Psychiatry | Neupsy Key

The treatment of mental disorders with drugs is not the same sort of activity as the use of drugs in medicine. Psychiatric drugs do not target underlying disease or symptom-producing mechanisms; they create an altered state of mental functioning that is superimposed on underlying feelings and behaviours. The ethical implications of the two situations are different.

Drug Treatment In Psychiatry [EBOOK]

Pariante describes experimental work with anti-inflammatory drugs as 'targeting a biochemical system in the body, to induce downstream effects in the brain, to eventually affect processes relevant to depression'. Both Pariante and Harmer and Cowen argue that drug action in psychiatry is essentially the same as it is in the rest of medicine.
