Unlike other textbooks on computer vision, this Guide to 3D Vision Computation takes a unique approach in which the initial focus is on practical application and the procedures necessary to actually build a computer vision system. The theoretical background is then briefly explained afterwards, highlighting how one can quickly and simply obtain the desired result without knowing the derivation of the mathematical detail.

This chapter describes the principles and computational procedures for triangulation that compute the 3D position of the point determined by a given pair of corresponding points over two images, using the knowledge of the positions, orientations, and internal parameters of the two cameras, which are specified by their camera matrices.
