Assist Control / Volume Control. (aka Continuous Mandatory Ventilation) You set: 1. Respiratory Rate and 2. Tidal Volume. If the patient wants additional breaths, the patient simply starts to breathe which drops the airway pressure which " triggers " the ventilator to deliver the set TV. Always the " Set " . TV.

An Intern ' s Guide to Ventilators

Normal inspiration generates negative intrapleural pressure, which creates a pressure gradient between the atmosphere and the alveoli, resulting in air inflow. In mechanical ventilation, the pressure gradient results from increased (positive) pressure of the air source. Peak airway pressure is measured at the airway opening (Pao) and is routinely displayed by mechanical ventilators.

Overview of Mechanical Ventilation - Critical Care ...

A mode of mechanical ventilation that provides volume-controlled breaths with the lowest pressure possible. It does so by altering the flow and inspiratory time. This mode is used to keep the peak airway pressure at the lowest possible level. This mode is volume-cycled and can be patient triggered-or time-triggered.

Mechanical ventilation can be provided via non-invasive or invasive means and involves the delivery of positive pressure breaths. Gas flow is delivered via a constant or decelerating pattern and the volume is dependent on inspiratory time, gas flow and pressure applied at the airway. Pressure, flow, time and volume are all interrelated.
