Synchrony between the different circadian oscillators and resonance with the solar day is largely enabled by a neural pacemaker, which is directly responsive to certain environmental cues and able to transmit internal time-of-day representations to the entire body.

Introduction. In a simplified form, epigenetics refers to heritable changes in phenotype that are not due to changes in the underlying DNA sequence. In this book, epigenetic mechanisms of regulation and dysregulation in health and disease are explored in great depth. Detailed chapters on epigenetic processes including DNA methylation and chromatin post-translational modifications including potential interventions with DNA methyltransferase inhibitors and histone deacetylase inhibitors are ...

Abstract. The cGAS-STING signalling axis, comprising the synthase for the second messenger cyclic GMP-AMP (cGAS) and the cyclic GMP-AMP receptor stimulator of interferon genes (STING), detects pathogenic DNA to trigger an innate immune reaction involving a strong type I interferon response against microbial infections. Notably however, besides sensing microbial DNA, the DNA sensor cGAS can also be activated by endogenous DNA, including extranuclear chromatin resulting from genotoxic stress ...

Burn wounds are one of the main causes of skin damage. Based on World Health Organization statistics, almost 300 000 people worldwide die of burns each year. In severe burns, the cells and blood vessels are often injured and the blood supply to the wound is disturbed. Many factors such as oxygenatio ...
