Occupational exposure. Occupational exposure to MOCA may occur through inhalation, ingestion and skin absorption: because of its low vapour, it can be inhaled as a dust when processed in a dry form; poor personal hygiene can allow contamination of the hands and ingestion while eating or smoking; however, the most likely route of exposure is thought to be by skin absorption after contact with contaminated surfaces (Linch et al., 1971; Clapp et al., 1991; Lowry & Clapp, 1992). Evaluations of ...

Hairdressers - Asbestos Risks, Products, Exposure & Lawsuits

Hairdressers today have an increased risk of developing occupational skin diseases due to exposure to skin irritants and sensitizers (van der Walle, 2000; Uter et al., 2003). Hair cosmetic products such as hair colours, permanent wave solutions and bleaches can cause contact allergy and the extensive wet work itself can cause irritant contact dermatitis.

exertion and wrist velocity of female hairstylists combined with prolonged exposure may account for the higher rate of hand/wrist

Ergonomic risk factors for the wrists of hairdressers.

Hairdressers are exposed to many hazardous agents in the workplace, including vapours, solvents, perfumes and dusts [1–7], capable of causing adverse health effects, particularly respiratory and dermatological problems.

Self-reported work-related symptoms in hairdressers ...

One of the hairdressers' concerns is long-term exposure to chemicals available at work, consisting of potential carcinogenic substances in hair dyes (Babish et al., 1991).
