SIP (Session Initiation Protocol) is a signaling protocol, widely used for setting up, connecting and disconnecting communication sessions, typically voice or video calls over the Internet. SIP is a standardized protocol with its basis coming from the IP community and in most cases uses UDP or TCP. The protocol can be used for setting up, modifying and terminating two-party (unicast), or multiparty

In VoIP, if port 2000 is open, it is a Cisco CallManager because the SCCP protocol uses that port as default, or if there is a UDP 5060 port, it is SIP. The -O Nmap option could be useful for identifying the running operating system, as there are a lot of VoIP devices that are running on a specific operating system, such as Cisco embedded.

### *How to attack an infrastructure using VoIP exploitation ...*

VoIP stands for Voice over Internet Protocol. It is also referred to as IP Telephony, Internet Telephony, and Internet Calling. It is an alternative way of making phone calls that can be very cheap or completely free. The 'phone' part is not always present anymore, as you can communicate without a telephone set.
